Application No. 10/695,467

IN THE SPECIFICATION:

Please amend paragraph [0035] as follows:

[0035] Structure 90 stores system default timeout value, used to determine when a virtual session should be terminated for inactivity. Structure 92 stores network bridge builder rules in 'ebtables' used to isolate virtual machines into a virtual network. Structure 94 is used as authentication and identification by the system login scripts. Structure 96 is the system log, used for auditing system events. Structure 98 stores geometry for loading and display of the virtual machine. Structure 100 stores session information used for tracking and managing of current sessions. Structure ~~137~~ 102 stores information about the slot a session is currently using. Structure 104 stores user information to permit login and auditing systems to authenticate and identify users. Structure 106 holds information about registered VIR hosts.

Please amend paragraph [0044] as follows:

[0044] In step 112, VAC 22 initiates continuous monitoring of a TCP/IP port for incoming information from computers 30, 32 or 34. Incoming information may include a request from a new VIR host for connection of an unregistered client 30, 32, 34 as illustrated by the cycle defined by steps 112, 114, 116 and 112. Alternatively, incoming information may include a request from a previously identified VIR host for processing of an instruction received from a currently registered client as illustrated by the cycle defined by steps 112, 114, 118 and 112.
